Motivation

Trust is a central notion in human centric communication. **Trustworthiness** is an important criterion for every Internet user. Establishment of trust relationships requires **omnipresent certification**. In order to **establish, verify, monitor, maintain and adapt** these relationships, formalization is required in the form of **comprehensive formal models**.

Main challenge

Formal definition of comprehensive and comprehensible **models of trust for complex communication spaces** as a basis for the development of techniques for the **validation** (by means of testing) and **verification** (by means of proof) of such models.

Expected results

Basic formal framework (concepts, definitions, characterizations) for reasoning about trust in communication spaces; **Publications**; **Follow-up project proposals**
